CivicLens

Project Status Report 1

Group 6:
- Alex L.
- Nikita U.
- Thomas S.
- Alwin R.

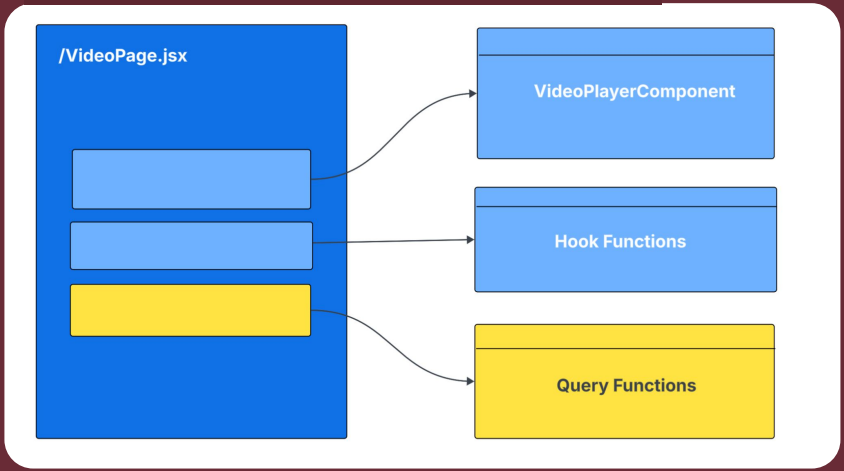
In the last two weeks:

Frontend:

- Refactored frontend files related to VideoPage.jsx
- Extracted functions and components for modularity and reusability(VideoPageUtility file for videoPage funcs)
  - Created VideoPlayer and ErrorMessage components
  - Created videoPageUtil
- Fixed timestamp jumping feature
- Modified the navbar; added logo and favicon

CivicLens

ENGAGE YOUR COMMUNITY



In the last two weeks:

Backend:

- Created unit and integration tests for api and db, refracted api code to include models
- Researched chunking methods, implemented semantic chunking method
- Installed OS on new server

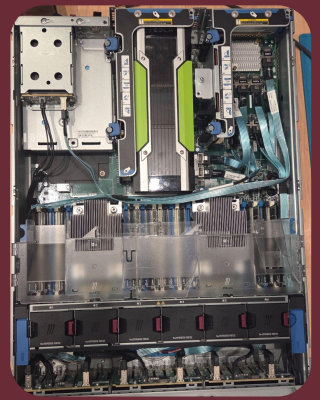
Sprint 5

Weekly sprint, tasks our team will focus on completing.

- COMP490 #23 — Install server
- COMP490 #24 — Get docker container running on server
- COMP490 #28 — Improve chunking on speaker lines
- COMP490 #29 — Implement chunking on meeting documents
- COMP490 #30 — Improve video player tabs

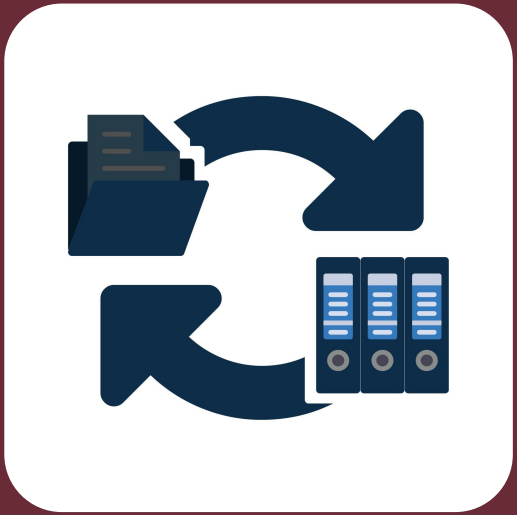
```python
class AgendaItem(BaseModel):
    model_config = ConfigDict(populate_by_name=True)

    title: str = Field(alias="Title")
    meeting_id: int = Field(alias="MeetingID")
    file_number: str = Field(alias="FileNumber")
    item_number: int = Field(alias="ItemNumber")
    description: str = Field(alias="Description")
    order_number: int = Field(alias="OrderNumber")
    agenda_item_id: int = Field(alias="AgendaItemID")
```



What worked and what didn't?

- Testing Issues
  - Setting up testing since both the API and DB are containerized. The DB connection strings are different for both the container and the local client. Went through FastAPI docs and google to find a solution.
- Docker Syncing
  - Docker seemed to be out of sync for different members
  - Began using ‘initial_sync’ option to potentially mitigate this



In the next two weeks:

Frontend:

- Develop custom UI for video player
- Update tagging function
- Improve nav design in VideoInfo component

Backend:

- Store meeting embeddings in DB
- Implement Chatbot service that performs RAG on saved embeddings

Thank you, Any Questions?
